

The final four items

Leader lines that do not end on the structure they name

Rounds Codex · compiled 16 August 2026

HOW TO READ EVERY FIGURE IN THIS DOCUMENT

- RED** crossed circle — where the leader, dot or badge ends NOW. The number matches the table.
- GREEN** plain circle — where it belongs, with an arrow running from red to green.

Every coordinate is in the SHIPPED page's own pixels, origin top-left. Where a page is off-standard its size is printed in the page header, so the numbers can be scaled if you work from a larger master.

Where a target is given as a coordinate it was measured, and the tissue under it was sampled with the leader's own ink excluded. Where a target is described in words but not numbered, it could not be pinned to a pixel from the shipped render and needs placing from the source file — those are marked PLACE FROM SOURCE and are not guesses to be actioned blindly.

Some rows cannot be fixed by moving anything: the structure the label names is not drawn on the page. Those say so explicitly. They need artwork or a different view, and re-aiming the leader would only move the error.

WHAT IS IN HERE

3 gallery pages, 4 measured findings. These are the pages whose corrections are measured and still open. Pages already corrected and deployed are not included.

PAGE	FINDINGS	WHAT IT IS
stroke — page 2	1	① CIRCLE OF WILLIS (inferior view)
aortic-stenosis — page 2	2	Cut heart
cardiomyopathy — page 1	1	One heart split into three phenotype slabs

How to make the corrections

1. Moving a leader tip or a dot — most of this document

Erase the last segment along the LEADER'S OWN AXIS, then redraw to the green point. Two things keep it invisible: take the stroke width and colour by sampling the leader itself a little way back from the tip, and erase along the axis rather than with a box, so the surrounding artwork is never touched.

The test that the move is clean: at the OLD endpoint, ink in a 13x13 box should fall to ZERO. If ink remains there, the leader was extended rather than moved, and the page now carries two terminators.

2. Never repaint artwork

If a fix would mean painting over illustration - erasing a disc of shaded tissue, rebuilding a background, redrawing a structure - stop and mark the page for a re-render instead. This has been attempted here and it does not repair cleanly; every large tissue-side erase left a visible patch. Several rows in this document say exactly that and are addressed to the illustrator, not to Photoshop.

3. Rows that no move can fix

Where the structure the label names is NOT DRAWN on the page, re-aiming the leader only moves the error somewhere else. Those rows say so in the text and need artwork or a different view - for example a lateral inset, an added slab, or a redrawn tracing. Rows marked PLACE FROM SOURCE are ones we could not pin to a pixel from the shipped render; place them from the layered file.

4. Save at the SAME pixel dimensions

Do not resample, resize, crop or rotate. The coordinates in this document are in the shipped page's own pixels, and the app, the thumbnails and the download PDF are all built from that geometry. Save as JPEG at high quality - we re-encode on integration at the file's own quantisation tables and chroma sampling, so an exact quality match on your side is not needed, but a resize breaks everything downstream.

5. Send the corrected page back; do not rebuild anything else

We regenerate the thumbnail and rebuild that gallery's download PDF. That second step matters: the download PDF is a separate build artefact and drifts from the pages if it is not rebuilt - four galleries shipped for months with an old logo in the PDF while the app showed the current one.

6. One page at a time is fine

Corrections are integrated and deployed in batches of about six pages. Each one is measured against the sheet before it ships - what was fixed, what was missed, and what was left - and that measurement is reported back honestly rather than assumed.

stroke — page 2

① CIRCLE OF WILLIS (inferior view) · stroke-02.jpg · 1024×1536 px · 1 findings

1 item — a label that was DELETED and needs restoring. Not a leader move.

The correction pass deleted TWO label blocks from this panel: 'Middle Communicating Artery (PCoA)' - correctly, because no such vessel exists and it duplicated the PCoA abbreviation - and 'Posterior Communicating Artery (PCoA)', which is real. Verified on the current live file: the label column now reads ICA, PCA, Basilar Artery, Vertebral Arteries, with no communicating artery entry. The PCoA is one of the two vessels that make the circle a circle, and it is the collateral pathway this panel's own caption is about.

WHAT TO CHANGE

- 1 Posterior Communicating Artery (PCoA) — RESTORE
NOW (196,530) the gap in the label column where the entry used to sit, between "Posterior Cerebral Artery (PCA)" and "Basilar Artery"
MOVE TO (105,487) the short vessel joining the ICA terminus to the PCA, on the viewer-right side of the circle.
APPROXIMATE - confirm from source. The mirror vessel on the viewer-left is near (52,483)

stroke — page 2 — close-ups

red crossed circle = where it ends now green plain circle = where it belongs

1 Posterior Communicating Artery (PCoA) — RESTORE

(196,530) the gap in the label column where the entry used to sit, between "Posterior Cerebral Artery (PCA)" and "Basilar Artery"

-> (105,487) the short vessel joining the ICA terminus to the PCA, on the viewer-right side of the circle.

APPROXIMATE - confirm from source. The mirror vessel on the viewer-left is near (52,483)

NOTES

DO NOT restore the 'Middle Communicating Artery' entry - there is no such vessel and deleting it was right. This is a text-plus-leader ADDITION, so it needs the panel's own label font; if that cannot be matched cleanly, send this one to production rather than approximating it. The target coordinate is the least certain thing in this document and is marked so deliberately: the PCoA and the anterior choroidal artery are adjacent in an inferior view and this render does not separate them at the resolution available.

aortic-stenosis — page 2

Cut heart · aortic-stenosis-02.jpg · 1138×1707 px · 2 findings

2 items — one ADDITION, one LAYOUT change. Both verified against the current live file.

The Pulmonary Trunk label was corrected in v120 and its endpoint is now right - it terminates at (644,512), sampling (134,136,168), on the blue trunk. Two consequences of how that fix was made are still open.

WHAT TO CHANGE

- Inferior Vena Cava — ADD a label**
NOW (365,1010) sampled (97,109,167) - the blue IVC, which the old Pulmonary Trunk label used to point at and which now carries NOTHING
MOVE TO (365,1010) same point. The page already labels the SUPERIOR vena cava a short distance above, so a reader sees one cava named and one not. One line of type plus a short leader completes the pair
- Pulmonary Trunk — RE-SITE the label block**
NOW (644,512) endpoint CORRECT, sampled (134,136,168) on the blue trunk, ink 93. The problem is the route: the label block stayed at lower-left, so the leader runs diagonally from about (255,1105) across the right ventricle, the tricuspid chordae and the LVOT
MOVE TO PLACE FROM SOURCE - move the label BLOCK to the upper left or upper centre beside the vessel, then shorten the leader. There is no single pixel to give; this is a layout decision

aortic-stenosis — page 2 — close-ups

red crossed circle = where it ends now green plain circle = where it belongs

1 Inferior Vena Cava — ADD a label

(365,1010) sampled (97,109,167) - the blue IVC, which the old Pulmonary Trunk label used to point at and which now carries NOTHING
-> (365,1010) same point. The page already labels the SUPERIOR vena cava a short distance above, so a reader sees one cava named and one not. One line of type plus a short leader completes the pair

2 Pulmonary Trunk — RE-SITE the label block

(644,512) endpoint CORRECT, sampled (134,136,168) on the blue trunk, ink 93. The problem is the route: the label block stayed at lower-left, so the leader runs diagonally from about (255,1105) across the right ventricle, the tricuspid chordae and the LVOT
-> PLACE FROM SOURCE - move the label BLOCK to the upper left or upper centre beside the vessel, then shorten the leader. There is no single pixel to give; this is a layout decision

NOTES

Item 1 is the easy one and worth doing even if nothing else here is: it is additive, nothing is erased, and it fixes a visible asymmetry. Item 2 is cosmetic - no reader will misidentify anything - and is raised only because this is a hero anatomy page and the crossing is conspicuous. If the label font cannot be matched for item 1, send both to production.

cardiomyopathy — page 1

One heart split into three phenotype slabs · cardiomyopathy-01.jpg · 1138×1707 px · 1 findings

1 item — and it CANNOT be fixed by moving anything. Read the note before touching this page.

Verified on the current live file: the ARRRHYTHMOGENIC callout still terminates at (772,861), ink 93, inside the RESTRICTIVE slab. Slab boundaries measured from the captions put the dividers at x 352 and x 640, so anything beyond 640 is the restrictive third. Two of the three actionable callouts were fixed in v120; this is the one that was always going to need artwork.

WHAT TO CHANGE

1 ARRHYTHMOGENIC

NOW (772,861) sampled (126,105,133), ink 93 - inside the RESTRICTIVE slab, which is a different phenotype from the one the callout names

MOVE TO NOTHING TO POINT AT - no arrhythmogenic slab is drawn. Either a fourth slab is added, or the callout is removed

cardiomyopathy — page 1 — close-ups

red crossed circle = where it ends now green plain circle = where it belongs

1 ARRHYTHMOGENIC

(772,861) sampled (126,105,133), ink 93 - inside the RESTRICTIVE slab, which is a different phenotype from the one the callout names

-> NOTHING TO POINT AT - no arrhythmogenic slab is drawn. Either a fourth slab is added, or the callout is removed

NOTES

THE PHOTOSHOP OPTION IS DELETION, NOT MOVEMENT. There is no correct place on this page for this callout, so dragging it anywhere just relocates the error. If you want this page fixed today, delete the ARRHYTHMOGENIC callout and its leader and carry ACM on its own panel later - that is a real fix, not a compromise, because a three-way comparison that shows three phenotypes is honest while a four-way one that shows three is not. The alternative is a production re-render adding a fourth slab, and note it would have to show the RIGHT ventricle: ACM is classically RV, while every existing slab is cut to show the LV. That is why this is artwork rather than layout.
